Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A subscriber circuit, provided with a feeding circuit for feeding current of a call to a terminal through a subscriber line and a switching circuit group for connecting the feeding circuit to the subscriber line and releasing the feeding circuit from the subscriber line, for controlling feeding to the terminal, comprising:

said feeding circuit monitoring state of a loop of the subscriber line, converting a two-wire signal sent from the terminal into a signal predetermined coefficient-fold, and supplying the same;

a level converter, connected to the subscriber line through said switching circuit group, for converting which converts a two-wire signal sent from the terminal into a signal any coefficient-fold and supplying supplies the same, separately from said feeding circuit; and

a signal monitor means for monitoring a signal, using one of an output signal of said feeding circuit and an output signal of said level converter, according to upper control information and the output of monitoring the loop of said feeding circuit, and supplying signal monitor information.

a signal output circuit which receives the output signal of said feeding circuit and the output signal of said level converter and supplies one of the signals,

a wave filter which filters the output signal of said signal output circuit,

a signal monitor which monitors a signal based on the output signal of said wave filter and supplies signal monitor information, and

a control circuit which controls connection and disconnection by said switching circuit group, output of said feeding circuit, output of said level converter, and operation of said signal output circuit, depending on the

-2-

operation, according to the upper control information and the loop monitoring output of said feeding circuit.

- 2. (Cancel).
- 3. (Cancel).
- 4. (Original) A subscriber circuit as claimed in claim 1, wherein the coefficient used for said feeding circuit converting the two-wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold.
 - 5. (Cancel).
 - 6. (Cancel).
 - 7. (Original) A subscriber circuit as claimed in Claim 1, wherein said feeding circuit is formed by a transistor.
 - 8. (Cancel).
 - 9. (Cancel).
- 10. (Original) A subscriber circuit as claimed in Claim 1, wherein the coefficient used for said feeding circuit converting the two—wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold, and said feeding circuit is formed by a transistor.

- 11. (Original) A subscriber circuit as claimed in claim 1, wherein said level converter is formed by a converter.
- 12. (Cancel).
- 13. (Cancel).
- 14. (Original) A subscriber circuit as claimed in Claim 1, wherein the coefficient used for said feeding circuit converting the two-wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold, and said level converter is formed by a converter.
- 15. (Original) A subscriber circuit as claimed in claim 1, wherein said feeding circuit is formed by a transistor, and said level converter is formed by a converter.
- 16. (New) A subscriber circuit, provided with a feeding circuit for feeding current of a call to a terminal through a subscriber line and a switching circuit group for connecting the feeding circuit to the subscriber line and releasing the feeding circuit from the subscriber line, for controlling feeding to the terminal, comprising:

said feeding circuit monitoring state of a loop of the subscriber line, converting a two-wire signal sent from the terminal into a signal predetermined coefficient-fold, and supplying the same;

a level converter, connected to the subscriber line through said switching circuit group, which converts a two-wire signal sent from the terminal into a signal any coefficient-fold and supplies the same, separately from said feeding circuit;

a wave filter which filters the output signal of said feeding circuit and the output signal of said level converter;

a signal output circuit which receives the output signal of said feeding circuit and the output signal of said level converter filtered through said wave filter, and supplies one of the signals;

a signal monitor which monitors a signal according to the output signal of said signal output circuit and supplies the signal monitor information; and

a control circuit which controls connection and disconnection by said switching circuit group, output of said feeding circuit, output of said level converter, and operation of said signal output circuit, depending on the operation, according to the upper control information and the loop monitoring output of said feeding circuit.

- 17. (New) A subscriber circuit as claimed in Claim 16, wherein the coefficient used for said feeding circuit converting the two-wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold.
 - 18. (New) A subscriber circuit as claimed in Claim 16, wherein said feeding circuit is formed by a transistor.
 - 19. (New) A subscriber circuit as claimed in Claim 16, wherein

the coefficient used for said feeding circuit converting the two-wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold, and said feeding circuit is formed by a transistor.

- 20. (New) A subscriber circuit as claimed in Claim 16, wherein said level converter is formed by a converter.
 - 21. (New) A subscriber circuit as claimed in Claim 16, wherein

the coefficient used for said feeding circuit converting the two-wire signal into a signal coefficient-fold is identical to the coefficient used for said level converter converting the two-wire signal into a signal coefficient-fold, and said level converter is formed by a converter.

22. (New) A subscriber circuit as claimed in Claim 16, wherein said feeding circuit is formed by a transistor, and said level converter is formed by a converter.
